Revision History

Version	Primary Author(s)	Description of Version	Date Completed
v1.0	Mohammed Sinan Anjith krishna A L Razin Mahmood Steve Sony Jacob	Initial draft of the Software Requirements Specification (SRS) for the E-Commerce Management System, outlining the system requirements, IEEE SRS structure, AI-powered Virtual Try-On feature, and supporting documentation	05-08-2026

1 Introduction

1.1 Purpose

This Software Requirements Specification (SRS) describes the requirements for the **E-Commerce Management System**. The system is designed to provide a centralized platform where customers can browse products, place orders, make secure payments, and track deliveries, while sellers and administrators can efficiently manage products, inventory, and transactions. In addition, the system includes an **AI-powered Virtual Try-On** feature that allows customers to preview supported clothing and accessories before purchasing them.

The purpose of this document is to clearly define the system's functional and non-functional requirements. It serves as a common reference for developers, testers, project members, and instructors throughout the software development process. The document will guide the design, implementation, testing, deployment, and future maintenance of the system.

1.2 Document Conventions

This document follows the IEEE Software Requirements Specification (SRS) format to ensure consistency and clarity. The following conventions are used throughout the document:

- **Times New Roman, 12-point font** is used for all text.
- **1.5 line spacing** is maintained throughout the document.
- Headings and subheadings follow the standard IEEE numbering format.
- Tables are used where appropriate to present definitions, data dictionaries, and other structured information.
- UML diagrams and other analysis models are included wherever necessary.
- The word **"shall"** is used to specify mandatory system requirements, while **"should"** is used for recommended behavior.
- Functional requirements are uniquely numbered to make implementation and testing easier.

1.3 Intended Audience and Reading Suggestions

This document is intended for several groups involved in the development and evaluation of the project.

- **Project Instructor/Evaluator** – to review and assess the system requirements.
- **Developers** – to understand the system requirements before implementation.
- **Testers** – to verify that the developed system satisfies all specified requirements.
- **Project Team Members** – to maintain consistency during development.
- **Future Maintainers** – to understand the system for future updates and enhancements.

The document is organized into multiple sections. The introduction provides an overview of the project and the purpose of the document. The following sections describe the system, its users, interfaces, functional requirements, and non-functional requirements. The appendices include supporting information such as the glossary, analysis models, and other reference material.

1.4 Product Scope

The **E-Commerce Management System** is a web-based application that enables customers to buy and sell products through a centralized online marketplace. Customers can browse products, search for items, manage shopping carts, place orders, make secure online payments, and track deliveries. Sellers can manage product listings, inventory, and customer orders, while administrators oversee the overall operation of the platform.

To improve the shopping experience, the system also provides an **AI-powered Virtual Try-On** feature for supported clothing and accessories. Customers can upload a photo or use their device camera to virtually try on products such as shirts, dresses, jackets, shoes, glasses, hats, watches, and jewellery before making a purchase. Products that support this feature are clearly identified in the catalog.

The main goals of the system are to simplify online shopping, improve inventory and order management, provide a secure and user-friendly platform, and help customers make better purchasing decisions through virtual product visualization.

1.5 References

The following references were used while preparing this Software Requirements Specification:

1. IEEE Std 830-1998 – *IEEE Recommended Practice for Software Requirements Specifications*.
2. Course materials and lecture notes for **Object-Oriented Analysis and Design (OOAD)**.
3. UML (Unified Modeling Language) documentation and design guidelines.
4. Documentation for standard web technologies such as HTML, CSS, JavaScript, and MySQL.
5. Documentation related to secure online payment gateway integration.
6. Technical documentation and research on AI-based image processing and virtual try-on technology for apparel and accessories.

2 Overall Description

2.1 Product Perspective

The **E-Commerce Management System** is a web-based platform developed to make online shopping and selling easier for both customers and sellers. It brings together customers, sellers, delivery agents, and administrators into a single system where each user can perform their tasks efficiently. The platform reduces the need for manual processes by managing products, orders, payments, inventory, and deliveries through a centralized application.

Customers can browse products, add items to their shopping cart, place orders, make secure payments, and track their deliveries. Sellers can upload and manage products, update stock levels, and process customer orders. Delivery agents update delivery information, while administrators oversee the entire platform by managing users, monitoring transactions, and generating reports.

To provide a better shopping experience, the system also includes an **AI-powered Virtual Try-On** feature for selected clothing and accessories. Customers can upload a photo or use their device camera to see how supported items such as shirts, dresses, jackets, shoes, glasses, hats, watches, and jewellery would look before purchasing them. Products that support this feature are clearly marked in the product catalog, helping customers make more confident buying decisions and reducing unnecessary product returns.

The system communicates with external services such as a secure payment gateway, notification services, and an AI image processing service to support payments, notifications, and virtual try-on functionality.

2.2 Product Functions

The E-Commerce Management System provides the following major functions:

- User registration and secure login.
- Role-based access for customers, sellers, delivery agents, and administrators.
- Product listing, inventory management, and catalog maintenance.
- Product browsing, searching, and category filtering.
- Shopping cart management and online order placement.
- Secure payment processing through an integrated payment gateway.
- Order tracking and delivery status updates.
- Return and refund management.
- Administrative monitoring and report generation.
- AI-powered Virtual Try-On for supported clothing and accessories.
- Image upload or camera-based virtual try-on.
- Real-time preview of clothing and accessories before purchase.
- Saving and comparing virtual try-on results.

2.3 User Classes and Characteristics

The system is designed for four main types of users, each with different responsibilities and levels of access.

Customer

Customers are the primary users of the platform. They can browse products, search for items, add products to their cart, place orders, make payments, track deliveries, request returns, and use the AI Virtual Try-On feature for supported products. Customers are expected to have basic knowledge of using the internet and web applications.

Seller

Sellers are responsible for managing products available on the platform. They can add, edit, and remove products, maintain inventory, process customer orders, and enable the Virtual Try-On feature by uploading the required product images for supported clothing and accessories.

Delivery Agent

Delivery agents manage assigned deliveries and update the delivery status of customer orders. Their access is limited to delivery-related activities.

Administrator

Administrators have full control over the platform. They manage users, monitor products and transactions, generate reports, and ensure the smooth operation and security of the system.

2.4 Operating Environment

The E-Commerce Management System is designed as a web application that can be accessed through modern web browsers on desktops, laptops, tablets, and smartphones.

The system operates in the following environment:

- **Operating Systems:** Windows 10/11, Linux, macOS, Android, and iOS.
- **Web Browsers:** Google Chrome, Mozilla Firefox, Microsoft Edge, and Safari.
- **Server:** Apache or Nginx.
- **Database:** MySQL.
- **Development Technologies:** HTML5, CSS3, JavaScript, and other standard web technologies.
- **External Services:** Payment gateway, email/SMS notification service, AI image processing service, and cloud storage for product and user images.

Network: A stable internet connection is required for normal operation and AI-based features.

2.5 Design and Implementation Constraints

The following constraints should be considered during the development of the system:

- The application will be developed as a web-based platform.

- Standard web technologies will be used for implementation.
- MySQL will be used as the primary database management system.
- Secure integration with a third-party payment gateway is required.
- The AI Virtual Try-On feature relies on image processing and computer vision technologies.
- Sellers must upload suitable product images before the Virtual Try-On feature can be enabled for clothing and accessories.
- All communication between the client and server must use secure protocols such as HTTPS.
- The system design will follow the COMET methodology.
- UML diagrams will be used during system analysis and design.

2.6 User Documentation

The following documentation will be provided to support users and administrators:

- Customer User Manual
- Seller User Guide
- Administrator Manual
- Quick Start Guide
- Online Help and Frequently Asked Questions (FAQs)
- Installation and Deployment Guide
- API documentation for supported external integrations

2.7 Assumptions and Dependencies

The development of the system is based on the following assumptions:

- Users have access to a stable internet connection and basic computer or smartphone skills.
- Payment gateway services remain available throughout system operation.
- The hosting environment is available and properly configured.
- External services such as payment gateways, notification services, and AI image processing APIs remain stable and accessible.
- The AI Virtual Try-On feature depends on accurate product images uploaded by sellers and compatible AI image processing services.
- Future changes to third-party APIs or external services may require updates to the system.
- Users access the platform through modern web browsers that support current web technologies.

3 External Interface Requirements

3.1 User Interfaces

The E-Commerce Management System provides a web-based interface that can be accessed through modern web browsers on desktops, laptops, tablets, and smartphones. The interface is designed to be responsive, easy to navigate, and consistent across different devices, allowing users to perform their tasks with minimal effort.

Different interfaces are available based on the user's role.

Customer Interface

The customer interface allows users to:

- Register and log in to the platform.
- Browse and search for products.
- View detailed product information.
- Add products to the shopping cart.
- Complete purchases using secure online payment.
- Track orders and request returns.
- Use the **AI Virtual Try-On** feature for supported clothing and accessories.
- Save favourite products and compare virtual try-on results.

Seller Interface

The seller interface enables sellers to:

- Add, edit, and remove products.
- Manage inventory and stock availability.
- Process customer orders.
- Upload product images and enable the AI Virtual Try-On feature for supported clothing and accessories.
- View sales reports and order history.

Delivery Agent Interface

Delivery agents can:

- View assigned deliveries.
- Update delivery status.
- Confirm successful deliveries.

Administrator Interface

Administrators have access to:

- User management.
- Product and inventory monitoring.
- Transaction management.
- Sales and inventory reports.
- Overall system monitoring and maintenance.

All interfaces use a consistent layout with clear navigation menus, search functionality, confirmation dialogs, and informative error messages to improve the overall user experience.

3.2 Hardware Interfaces

The system does not require specialized hardware and can operate on commonly available computing devices.

Supported hardware includes:

- Desktop and laptop computers.
- Tablets.
- Smartphones.
- Web servers hosting the application and database.
- Standard networking equipment for internet connectivity.

The AI Virtual Try-On feature may additionally use:

- Built-in or external device cameras.
- Mobile phone cameras.
- Local device storage for temporary image processing.

Support for barcode scanners, RFID readers, or Point-of-Sale (POS) devices is outside the current project scope.

3.3 Software Interfaces

The E-Commerce Management System communicates with several external software components to provide its services.

These include:

- **Payment Gateway** for secure payment processing and refunds.
- **MySQL Database** for storing user accounts, products, inventory, orders, payments, and transaction records.
- **Email and SMS Notification Services** for order confirmations, delivery updates, password recovery, and promotional notifications.
- **AI Image Processing Service** for body detection and Virtual Try-On rendering.
- **Cloud Storage Service** for storing product images and customer images (when permission is granted).

Communication between the application and these services is performed through secure REST APIs using HTTPS.

3.4 Communication Interfaces

The system communicates with users and external services using standard web communication protocols.

Communication interfaces include:

- HTTP/HTTPS for browser-based communication.
- Secure REST APIs for payment gateways, AI image processing, and notification services.
- Email and SMS services for customer notifications.
- JSON format for exchanging data between the application and external services.

To protect user information:

- All communication is encrypted using HTTPS/TLS.
- User authentication is required before accessing protected services.
- Sensitive information such as payment details and uploaded images is transmitted securely.

4 System Features

4.1 User Registration

Description

The system allows customers, sellers, and delivery agents to create accounts by providing the required personal information.

Priority

High

Functional Requirements

- The system shall allow users to register with valid personal details.
- The system shall store user information securely.
- The system shall assign the appropriate role during registration.

4.2 User Login and Role-Based Access

Description

Registered users can securely access the platform according to their assigned roles.

Priority

High

Functional Requirements

- The system shall authenticate users using valid credentials.
- The system shall provide role-based access to system features.
- The system shall prevent unauthorized access to restricted resources.

4.3 Product Listing and Management

Description

Sellers manage products available on the platform by adding, updating, and removing listings.

Priority

High

Functional Requirements

- The system shall allow sellers to add new products.
- The system shall allow sellers to edit or remove existing products.
- The system shall maintain accurate inventory information.
- The system shall allow sellers to enable the **Virtual Try-On** feature for supported clothing and accessories by uploading suitable product images.

4.4 Product Browsing and Searching

Description

Customers can browse products by category or search for specific items.

Priority

High

Functional Requirements

- The system shall allow browsing by category.
- The system shall support keyword-based product searches.
- The system shall display detailed product information.
- Products supporting Virtual Try-On shall display a "**Virtual Try-On Available**" label.

4.5 Shopping Cart Management

Description

Customers can manage products before placing an order.

Priority

High

Functional Requirements

- The system shall allow customers to add products to the shopping cart.
- The system shall allow quantity modification.
- The system shall allow products to be removed from the cart.
- The system shall retain the shopping cart until checkout.

4.6 Order Placement

Description

Customers can purchase products available in their shopping cart.

Priority

High

Functional Requirements

- The system shall verify product availability before confirming an order.
- The system shall generate a unique order number.
- The system shall create an order record after successful payment.

4.7 Payment Processing

Description

The platform supports secure online payment using an integrated payment gateway.

Priority

High

Functional Requirements

- The system shall process online payments securely.
- The system shall notify customers about payment success or failure.
- The system shall store transaction records.

4.8 Inventory Management

Description

Inventory is automatically updated whenever purchases or returns occur.

Priority

Medium

Functional Requirements

- The system shall reduce stock after successful purchases.
- The system shall restore stock after approved returns.

- The system shall prevent purchases when products are unavailable.

4.9 Order Tracking and Delivery Management

Description

Customers can monitor their orders while delivery agents update delivery progress.

Priority

Medium

Functional Requirements

- Customers shall be able to track order status.
- Delivery agents shall update delivery progress.
- Customers shall receive delivery notifications.

4.10 Return and Refund Management

Description

Customers can request returns for eligible products.

Priority

Medium

Functional Requirements

- The system shall allow customers to submit return requests.
- Approved refunds shall be processed through the payment gateway.
- Inventory shall be updated after successful returns.

4.11 Administrative Monitoring and Reporting

Description

Administrators oversee platform activities and generate reports.

Priority

Medium

Functional Requirements

- The system shall manage users and products.
- The system shall generate sales, inventory, and transaction reports.
- The system shall maintain centralized records.

4.12 AI Virtual Try-On

Description

The AI Virtual Try-On feature allows customers to preview supported clothing and accessories before making a purchase by using AI image processing.

Priority

High

Functional Requirements

- The system shall allow customers to upload an image or use their device camera.
- The system shall detect body or facial landmarks automatically.
- The system shall generate a realistic preview of supported clothing and accessories.
- The system shall allow customers to change colours and sizes during the preview.
- The system shall allow customers to save or compare virtual try-on results.
- Only products marked as **Virtual Try-On Supported** shall display this feature.

4.13 Stimulus/Response Sequence (Virtual Try-On)

Stimulus: Customer selects "Try On" for a supported product.

System Response:

1. Verify that the selected product supports Virtual Try-On.
2. Allow the customer to upload an image or open the device camera.
3. Process the image using the AI image processing service.
4. Generate the virtual preview.
5. Display the generated preview.
6. Allow the customer to compare, save, or purchase the product directly from the preview screen.

5 Other Nonfunctional Requirements

5.1 Performance Requirements

The E-Commerce Management System is designed to provide a fast, reliable, and responsive shopping experience even during periods of high user activity.

P1. Page Load Time

- The system should load major pages, including the home page, product catalog, login page, shopping cart, and checkout page, within **3 seconds** under normal network conditions.
- Product images and Virtual Try-On assets should be optimized to minimize loading time.

Rationale: Fast page loading improves user experience and reduces bounce rates.

P2. Search and Filter Performance

- Product search results should be displayed within **2 seconds** after a user submits a query.
- Category filters and sorting options should update product listings without noticeable delay.

Rationale: Quick search results help customers find products more efficiently.

P3. Payment Processing

- Payment confirmation should be completed within **5 seconds**, excluding delays caused by external banking services.
- Users should immediately receive confirmation of successful or failed transactions.

Rationale: Faster payment processing reduces abandoned purchases.

P4. AI Virtual Try-On Performance

- Virtual Try-On previews should be generated within **5 seconds** under normal operating conditions.
- The system should support image uploads without significantly affecting application performance.

Rationale: Customers expect near real-time previews while shopping

P5. Concurrent Users

- The system should support at least **100 concurrent users** performing browsing, ordering, and Virtual Try-On operations without noticeable performance degradation.

Rationale: Ensures the platform remains responsive during peak shopping periods.

5.2 Safety Requirements

The system should protect users and their data from accidental loss or system failures.

S1. Payment Failure Handling

- If a payment fails, no order should be confirmed and no inventory should be deducted.

Rationale: Prevents financial loss and inconsistent order records.

S2. Data Backup and Recovery

- The database should be backed up automatically at least once every **24 hours**.
- Backup copies should be stored securely to allow recovery in case of failure.

Rationale: Protects important system data.

S3. Error Handling

- The system should display clear and user-friendly error messages.
- Internal system information should never be exposed to users.

S4. AI Image Processing Safety

- Images uploaded for the Virtual Try-On feature should be processed securely.
- Users should be able to delete uploaded images after use if they choose.

Rationale: Protects user privacy and prevents unnecessary storage of personal images.

5.3 Security Requirements

Security is essential because the system handles user accounts, payments, and personal information.

SEC1. User Authentication

- Registered users must log in using valid credentials before accessing their accounts and personalized features.

SEC2. Secure Communication

- All communication between users, servers, payment gateways, and AI services should use **HTTPS/TLS encryption**.

Rationale: Protects sensitive information during transmission.

SEC3. Role-Based Access Control

- Customers, sellers, delivery agents, and administrators should only access features assigned to their roles.

SEC4. Data Privacy

- Personal information, payment details, and uploaded images should be stored securely.
- Customer images used for Virtual Try-On should only be used for generating previews and should not be shared with third parties without user consent.

SEC5. Session Management

- Users should be automatically logged out after **15 minutes** of inactivity.

SEC6. Secure Image Storage

- Images uploaded for Virtual Try-On should be encrypted while stored.

- Temporary images should be deleted automatically after processing unless users choose to save them.

5.4 Software Quality Attributes

The system is designed to provide a reliable, secure, and user-friendly shopping experience while remaining easy to maintain and expand.

Reliability

- The system should be available at least **99%** of the time, excluding scheduled maintenance.
- Orders, payments, and inventory records should remain accurate without duplication or data loss.

Usability

- Customers should be able to complete a purchase in **five or fewer steps**.
- The Virtual Try-On feature should be simple enough for first-time users without requiring additional instructions.
- All pages should maintain a consistent layout and navigation style.

Maintainability

- The application should follow a modular architecture so that features such as payment processing, inventory management, and Virtual Try-On can be updated independently.

Scalability

- The system should support future expansion, including additional product categories, payment gateways, AI services, and higher user traffic.

Portability

- The application should function correctly on major operating systems and modern web browsers.

5.5 Business Rules

The following business rules govern how the platform operates.

- Customers must create an account before placing an order.
- Sellers are responsible for maintaining accurate product information and inventory.
- Only administrators can manage user accounts and system-wide settings.
- Products marked "**Virtual Try-On Available**" must include the required images for AI processing.
- The Virtual Try-On feature is available only for supported clothing and accessories.
- Returns and refunds are allowed only within the approved return period.
- Orders cannot be placed for products that are out of stock.
- Payment must be successfully completed before an order is confirmed.

6 Other Requirements

6.1 Database Requirements

The system uses a relational database to manage application data.

The database should:

- Store user profiles, products, inventory, orders, payments, deliveries, and transaction history.
- Store product images required for the Virtual Try-On feature.
- Enforce primary key, foreign key, and integrity constraints.
- Perform regular backups to prevent data loss.

6.2 Legal and Regulatory Requirements

The system should comply with applicable laws related to online commerce and user privacy.

The system should:

- Follow data protection and privacy regulations.
- Use secure payment methods approved by the payment gateway.
- Protect customer information from unauthorized access.
- Obtain user permission before processing uploaded images for Virtual Try-On.

6.3 Reusability Requirements

The system should be developed using reusable modules.

Reusable components include:

- Authentication
- Product Management
- Shopping Cart
- Order Processing
- Payment Module
- Inventory Module
- AI Virtual Try-On Module
- Notification Service

6.4 Internationalization (Future Scope)

Future versions of the system may support:

- Multiple languages
- Multiple currencies
- Country-specific payment methods

- Regional tax calculations

6.5 Deployment Requirements

The application should support deployment on both cloud and local servers.

It should be compatible with:

- Windows
- Linux
- Modern web browsers including Chrome, Firefox, Edge, and Safari
- Desktop and mobile devices

6.6 Future Enhancements

Possible future improvements include:

- Live AR-based Virtual Try-On using a mobile camera.
- AI-based size recommendations.
- Personalized fashion recommendations.
- Voice-based product search.
- Social media sharing of Virtual Try-On previews.
- Support for additional wearable accessories and cosmetic products.

Appendix A – Glossary

Include terms such as:

- **AI** – Artificial Intelligence
- **API** – Application Programming Interface
- **CRUD** – Create, Read, Update, Delete
- **SRS** – Software Requirements Specification
- **UI** – User Interface
- **Payment Gateway** – Service used to process secure online payments.
- **Virtual Try-On** – AI feature that lets customers preview supported clothing and accessories before purchase.
- **Body Detection** – AI process that detects body landmarks for virtual fitting.
- **Garment Overlay** – AI-generated placement of clothing on the customer's uploaded image.

Appendix B - Analysis Models

No separate analysis models are included in this Software Requirements Specification. The system architecture diagram presented in **Section 2.1 (Product Perspective)** provides a high-level overview of the E-Commerce Management System and its interaction with external entities.

Since this document focuses on specifying the software requirements, detailed UML diagrams such as use case diagrams, class diagrams, sequence diagrams, activity diagrams, and entity-relationship diagrams are not included.
